Lab 6.2 Build the personal engineering AI toolkit

IES | 10 minutes | LO7

All records are fictional training data. They describe no actual facility, person or organisation. Values are teaching assumptions, not approved design criteria. Do not use outputs to operate, maintain or approve real equipment.

Inputs and preparation

Open the mock-data folder: personal-toolkit.md, prompt-log.csv, agent-test-cases.csv, design-requirements.csv, DES-01-rev2.md, work-activity.txt, hazard-checklist.csv. Use prompts.md for copy and paste. Save your reviewed work under outputs. Earlier lab outputs are optional; this folder provides standalone inputs.

Procedure

1. Open personal-toolkit.md and choose one documentation workflow you can trial next week with approved synthetic or authorised data.

2. Copy one tested R.I.S.E. prompt and one E-MAP prompt into the toolkit. Include source versions, acceptance checks and a review gate.

3. Record your agents, knowledge scope, owner and access status. Pin or share only within approved tenant policy. Mark blueprint-only agents as not deployed.

Lab 6.2 continued

4. Define a simple trial measure: elapsed time including review and correction, factual errors and missing evidence. Record a baseline rather than promise a productivity gain.

5. Write one next action, owner, due date and stop condition. Save the toolkit and a prompt-log entry. Share one reusable pattern during closing discussion.

Check before moving on

Two prompt frameworks and one testable next action are present.

Live agent status is honest and a human review gate remains.

Access or source problems

Use approved paired access or the local source files. Record unavailable live capabilities as not executed. If an attachment is not supported, paste the short synthetic text or reference its approved SharePoint copy. Do not use personal accounts to bypass controls.

Lab 6.2 prompts and evidence

Main prompt

Turn my tested prompts and agent notes into a personal engineering AI toolkit. For each workflow include approved inputs, source versions, prompt, output, acceptance test, human reviewer and failure response. Keep untested capabilities clearly marked. Propose a one-week trial with review-inclusive timing and error tracking.

Verification prompt

Audit the draft against the named source files. List each claim, source location, uncertainty and correction. Recalculate key values independently. Return a revised draft and change log; do not approve the engineering deliverable.

Expected output example

Illustrative teaching example, not a recorded AI run. Next action: trial inspection-note summarisation on fictional records next week; compare total drafting plus review time and unsupported claims. Stop if a source cannot be traced or the tenant access is unapproved.

Retain your evidence

Keep the source versions, prompt, tool, output, corrections, independent checks and reviewer decision. Record any capability or permission test that was not executed. Use templates/prompt-log.csv. Do not publish real workplace data.
