Lab 2.4 - Weekly Update to the Supervisor

App: Microsoft 365 Copilot in **PowerPoint**

Purpose: Turn a week of roadside drainage inspections into a five-slide update the supervisor can read in two minutes.

Output: `Weekly-Drainage-Update.pptx`, built with Copilot from your own register and checked by you figure by figure.

Work in `Work-Order-Register.xlsx` — the file you have carried since Lab 2.1. This folder's `Starter.xlsx` supplies the week's inspection data as ready-made Excel tables; you copy its sheets across. The `.csv` files are a plain-text copy for the optional practice in Appendix A only.

Where this sits in Module 2

Lab	App	What you produce
2.1	Excel	The work order register
2.2	Word	The two inspection reports
2.3	Outlook	The approval request to the manager
2.4	**PowerPoint**	**The weekly update to the supervisor**

The scenario

It is Friday afternoon. The drainage supervisor holds a short team meeting every week and wants one thing: what happened on the network this week, and what still needs their attention.

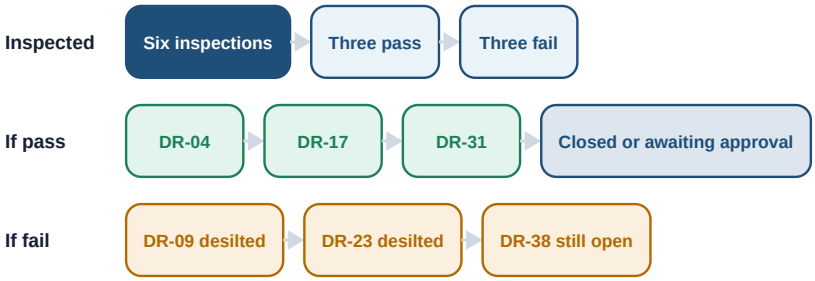
Your two work orders were part of a larger week. Six roadside drain sections were inspected against the same specification maximum of **50 mm silt depth**:

Work order	Day	Asset	Road	Silt depth	Outcome	Status
WO-019	Mon	DR-04	Serangoon Road	21 mm	Pass	Closed
WO-020	Mon	DR-09	Balestier Road	63 mm	**Fail**	Desilted, closed
WO-021	Wed	DR-17	Jalan Besar	32 mm	Pass	Awaiting approval
WO-022	Wed	DR-23	Clementi Avenue 2	74 mm	**Fail**	Desilted, awaiting approval
WO-023	Thu	DR-31	Upper Thomson Road	18 mm	Pass	Closed

Work order	Day	Asset	Road	Silt depth	Outcome	Status
WO-024	Fri	DR-38	Bukit Timah Road	88 mm	**Fail**	Rectification pending

WO-021 and WO-022 are the two you handled yourself in Labs 2.1 to 2.3. The other four were done by the rest of the team. **Remember that silt depth is a limit you stay under** — a bigger number is worse, and a bar above the line has failed.

The week, as a diagram



Two of the three failures were desilted and passed reinspection. The third, DR-38 on Bukit Timah Road, failed on Friday and has not been rectified. That is the item the supervisor most needs to see.

Two files, and which is which

File	What it is
`Work-Order-Register.xlsx`	**Your own working file**, carried from Labs 2.1 to 2.3. You add the week's data to it here.
`Starter.xlsx`	**This lab's supplied data.** You open it to copy sheets out, then close it without saving.

Files in this folder

File	Use
`Lab-Instructions.pdf`	This activity and every copy-ready Copilot prompt.
`Starter.xlsx`	This lab's supplied data: the `WeeklyInspections` and `Reinspections` tables, the hand-check figures and the two data traps.
`mock-data.csv`	The week's inspections as plain CSV. Not needed — Appendix A only.
`reinspections.csv`	The rectification outcomes as plain CSV. Not needed — Appendix A only.

Step 1 - Reopen your register and bring in the week's data

1. Open `Work-Order-Register.xlsx` — the register from Labs 2.1 to 2.3. This is where you work.
2. Open this folder's `Starter.xlsx` as well:

Sheet	What it holds
`Start_Here`	Where to begin, and what each sheet is for.
`Weekly_Inspections`	All six inspections as the named table `WeeklyInspections`.
`Reinspections`	What was done about each failed inspection.
`Check_Your_Work`	The eight figures to verify by hand.
`Reading_The_Data`	Two traps in this week's numbers, and why they matter.
`Copilot_Prompt`	All three prompts, ready to copy inside Excel.

3. Copy the `Weekly_Inspections` and `Reinspections` sheets into your register with **Move or Copy**.
4. Confirm your own WO-021 and WO-022 rows match what you recorded in Labs 2.1 and 2.2: 32 mm pass, and 74 mm fail then 28 mm on reinspection.
5. Close `Starter.xlsx` without saving.

Step 2 - Work out the figures by hand first

Do this **before** you open Copilot. If you do not know the right answers, you cannot tell whether the deck is right.

Figure	By hand	Answer
Total inspections	Count the rows	6
Passed first visit	WO-019, WO-021, WO-023	3
Failed first visit	WO-020, WO-022, WO-024	3
First-visit pass rate	3 / 6 = 0.5	50.0%
Failures desilted and passed	WO-020 and WO-022	2
Failures still open	WO-024 only	1
Awaiting manager approval	WO-021 and WO-022	2
Worst reading of the week	WO-024 at DR-38	88 mm

Step 3 - Summarise the week in Excel

1. In your register, select the `WeeklyInspections` table.
2. Open **Copilot** from the Home ribbon and paste the prompt below.
3. Compare every figure it returns against your hand-worked answers in Step 2.

Copy this prompt (Excel):

```
Use only the selected WeeklyInspections table.
Summarise the week for a supervisor update. Return, showing your arithmetic:
```

```
the total number of inspections; how many passed and how many failed on the
first visit; the first-visit pass rate as a percentage to one decimal place;
how many failures have been desilted and reinspected; and how many remain
open.

List the failed work orders separately with their asset, road, silt depth and
current status.

Silt depth is a maximum, not a minimum: a reading above 50 mm has failed. Do
not average the silt depths across different drain sections: they are separate
assets, and a mean tells the supervisor nothing useful. Do not invent a cause
for any failure.
```

Step 4 - Build the deck with Copilot in PowerPoint

1. Open PowerPoint and start a new presentation.
2. Open **Copilot**, and attach your `Work-Order-Register.xlsx`.
3. Paste the prompt below.

Copy this prompt (PowerPoint):

```
Create a five-slide weekly update presentation for the drainage supervisor,
using only the attached weekly inspection table and reinspection table.

Slide 1, title: Roadside drainage inspections, week of 16 to 20 September
2026, with the team name and the total number of inspections.

Slide 2, the week at a glance: total inspections, first-visit passes and
failures, the first-visit pass rate, and how many failures are now closed.
Use large figures, not paragraphs.

Slide 3, a bar chart of silt depth against the 50 mm maximum for all six work
orders, with the maximum shown as a clearly labelled threshold line so a
failing drain is visible at a glance. Bars above the line have failed.

Slide 4, the failures: WO-020, WO-022 and WO-024, each with asset, road,
initial silt depth, what desilting was done, the reinspection reading where
there is one, and the current status. Show that WO-024 is still open.

Slide 5, what needs the supervisor: WO-024 awaiting rectification, and WO-021
and WO-022 awaiting the manager's approval to close.

Use short labels and visuals rather than sentences. Every figure must come
from the attached tables. Do not invent a cause, a cost, a deadline, a
photograph or an approval. Do not describe any work order as closed unless the
table says so. Mark the deck DRAFT FOR SUPERVISOR REVIEW.
```

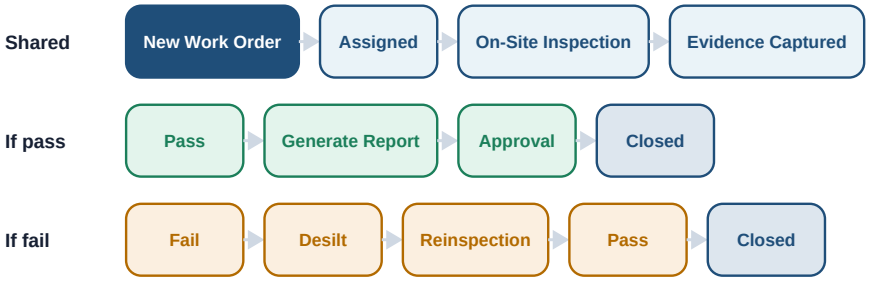
Step 5 - Add the workflow diagram

The supervisor sees these six work orders as one process. Add a slide showing it.

1. Insert a new slide after slide 2.
2. Use **Insert -> SmartArt -> Process** and build the shared path, or ask Copilot:

```
Add a slide with a left-to-right process diagram of the inspection workflow.
```

3. Enter the stages:



4. Mark on the diagram where this week's six orders currently sit: three closed, two awaiting approval, one awaiting rectification.

A supervisor reading a list of six work orders has to reconstruct the process in their head. A diagram with the counts on it does that work for them.

Step 6 - Check every figure against the source

Copilot will restate your numbers confidently. Verify them anyway, then run the audit prompt.

Copy this prompt (PowerPoint):

```
Check this presentation against the attached weekly inspection table.

List every figure on a slide that does not match the table, every work order
that is missing, any work order described with the wrong status, and any claim
about a cause, a cost or an approval that the table does not support.

Do not correct the slides. Report what is wrong and where.
```

Watch for these two traps, both on the `Reading_The_Data` sheet:

Trap	Why it matters
Averaging the silt depths	Each reading belongs to a different drain section. A mean of six drains describes no real asset and hides DR-38 at 88 mm.
Treating the pass rate as a score	50% first-visit pass means half the drains needed work, not that the team performed at 50%. Say what it counts.
Calling a desilted drain closed	WO-021 and WO-022 still await the manager's approval from Lab 2.3. Desilted is not closed.
Dropping WO-024	It failed on Friday and is not rectified. If it is missing from the deck, the one thing needing action this week is invisible.

Step 7 - Save your work

Now save your work.

1. Save the deck as `Weekly-Drainage-Update.pptx`.
2. In Excel, press **Ctrl+S** (**Cmd+S** on Mac) to save `Work-Order-Register.xlsx`. It now holds

all four labs' sheets: the intake and status history, the inspections and rectification, the approval log, and the week's data.

3. Export the deck to PDF if your trainer asks.

Your final file set is `Work-Order-Register.xlsx`, `Inspection-Plan.docx`, `RPT-021.docx`, `RPT-022-v2.docx`, the two sent emails, and `Weekly-Drainage-Update.pptx` — the full paper trail for the week, from a work order raised on Wednesday to the update the supervisor reads on Friday.

Pass conditions

- All six work orders appear, with the correct silt depth and status for each.
- The pass rate is 50.0%, and you checked it by hand before accepting it.
- The chart shows the 50 mm maximum as a threshold, with failing bars above it.
- WO-024 is shown as still open and appears in what needs the supervisor.
- No work order is described as closed unless the table says so.
- The deck invents no cause, cost, deadline, photograph or approval.
- A workflow diagram shows where this week's orders sit in the process.

Appendix A - Optional: import the CSVs yourself

You do not need this if you are using `Starter.xlsx`. Use it only for the import practice, or if the starter file is unavailable.

1. Open your `Work-Order-Register.xlsx`.
2. **Data** tab -> **Get Data** -> **From File** -> **From Text/CSV**.
3. Select `mock-data.csv`, choose **Import**, check the comma delimiter, then

Load To... -> **Table** -> **New worksheet** -> **OK**.

4. Click inside the new table. On **Table Design**, set **Table Name** to `WeeklyInspections`.

Rename the sheet tab to `Weekly_Inspections`.

5. Repeat for `reinspections.csv`, naming that table `Reinspections`.
6. Confirm `Silt_mm` and `Maximum_mm` are right-aligned, so Excel read them as numbers.
7. Save as **Excel Workbook (*.xlsx)**, keeping the sheets from Labs 2.1 to 2.3.

All records in this lab are fictional training data. They describe no actual facility, person or organisation. Values are teaching assumptions, not approved design criteria. Do not use any output to operate, maintain or approve real equipment.
