Lab 1.1 - Onboarding and Tool Access

Purpose: Confirm which Microsoft 365 Copilot surfaces are available before later labs depend on them.

Output: A completed access record for Copilot Chat, Word, Excel and Agents, including an approved fallback for anything unavailable.

What you will do

1. Sign in to the provided Microsoft 365 training account.
2. Open Copilot Chat and send a harmless test request.
3. Open Word and check whether Copilot is available.
4. Open Excel with `mock-data.csv` and check whether Copilot can use the file.
5. Open Agents and confirm whether **Create agent** and **Skills (Preview)** are available.
6. Record each surface as Available, Missing or Fallback.
7. Show the record to the trainer before continuing.

Files used

File	Use
`Lab-Instructions.pdf`	Detailed instructions; start here.
`mock-data.csv`	Synthetic file used only for the Excel access check.

Detailed steps

1. Open https://m365.cloud.microsoft/ in a desktop browser.
2. Sign in with the training account. Do not place the username, password or one-time code in any prompt.
3. Open **Copilot Chat**. Enter: `Reply with ACCESS CHECK COMPLETE. Do not analyse any organisational data.`
4. Record whether Chat responds successfully.
5. Open **Word**, create a blank document and look for the Copilot button or prompt area. Do not create a report.
6. Open **Excel**, open `mock-data.csv`, and look for Copilot. If available, ask it to state the number of data rows only. The correct answer is three.
7. Return to Copilot and open **Agents**. Confirm whether Agent Store and **Create agent** are visible.
8. If **Create agent** is visible, open it without creating anything. Record whether **Configure** and **Skills (Preview)** appear.
9. Complete this access record:

Surface	Record
Copilot Chat	Available / Missing / Fallback
Word Copilot	Available / Missing / Fallback
Excel Copilot	Available / Missing / Fallback
Agents	Available / Missing / Fallback
Create agent	Available / Missing / Fallback
Skills (Preview)	Available / Missing / Fallback

10. For every Missing item, ask the trainer for the approved fallback and record it. Do not invent a workaround or use a personal account.
11. Show the completed record to the trainer.

Independent checks

- The CSV contains one header row and three data rows.
- No credential or real engineering information was entered into a prompt.
- Missing access is recorded honestly rather than marked as completed.

Pass conditions

- Every required surface has a recorded status.
- Every missing surface has a trainer-approved fallback or is clearly marked unresolved.
- The learner can identify where **Create agent**, **Configure** and **Skills (Preview)** would appear.
- The access record contains no credentials.

All supplied records are fictional classroom data.
